

ET.PM4 Grading of Final Demonstration Technical Aspects

The demonstration of the developed radar system represents the final milestone of the ET.PM4 project. The grading is divided into technical aspects and non-technical / language aspects. This document focuses in particular on the evaluation of the technical aspects and provides the organizational guidelines of the demonstration sessions.

Organization

Dates:

- Wednesday morning, 17.6.2026 for class ET.PM4.002 (technical lecturer: renn)
- Monday, 22.6.2026 for classes ET.PM4.001 and ET.PM4.003 (technical lecturer: eand)

Audience: both ET.PM4 lecturers of a class

- huar / renn for class ET.PM4.002
- huar / eand for classes ET.PM4.001 and ET.PM4.003

Each project is allocated a 30-minute time slot, which includes the following:

- 10–12 minutes: Demonstration of the product/project by the students (project team members)
- Q&A session: Questions and discussion
- Evaluation: Grading by the lecturers (in absence of the students)
- Feedback: Short feedback provided to the students by the lecturers

These demonstration sessions will take place alternately in the lab rooms TS O4.15 and TS O4.18. Each project group will have approximately 30 minutes prior to their time slot to set up in the assigned room and prepare their demonstration.

All project members are expected to actively participate in the demonstration. All group members receive the same grade.

Grading of Technical Aspects

The following aspects contribute to the grading:

- User interface, and usability (of the product): Product idea/concept, ease of use and quality of the user interface.
- Signal acquisition and processing: The technical implementation of the signal processing. Range of functionality. Complexity of the implementation (where appropriate).
- Result representation: Depends on the implemented functionality. E.g., for a distance measurement device: achieved accuracy, stability, and measurement range.
- Test scenarios: Relevance and representativeness of the demonstrated use cases. Coverage of key objectives. Technical correctness of performed measurements and demonstrations. Level of preparation and organization
- Basic features: Implementation and demonstration of core functionality based on CW Doppler radar.
- Additional features: Any further implemented and demonstrated functionalities (e.g., distance measurement using FMCW radar, lenses, or own extensions/ideas). Range of functionality. Complexity of the implementation (where appropriate).

The technical aspects contribute 30% to the final ET.PM4 module grade.
